

iPulse
by VideogeniX

Why iPulse?

Lockups: Not a question of if – but when

Processors in network devices inevitably lock up and must be reset manually.

A preventative and proactive solution

Lock ups mean lost communications, high maintenance , loss of remote control and possible liability. Why wait? Be proactive!

Universal

Easy to use and install. Perfect for new or retrofit applications. Reboots any network communication device.

Not a networking device

iPulse can sense communication without any additional ports, IP address, software or involvement from IT.

Zero security risk

Originally designed for high level government applications, iPulse does not open any security risk.

No need for its own power supply

iPulse connects in line with whatever communication device it is rebooting.

Reboots automatically or by schedule

You have control of how you need iPulse to work in your application. No human intervention needed!

Thousands already employed in power applications

iPulse is the solution in engineered access, substations, SCADA, AMI/AMR, collectors, surveillance and security.

Immediate ROI

Pays for itself the first time we eliminate a truck roll. Save time, money and lost data!

Keep your systems communicating reliably!

It simply makes sense to put iPulse on every network device.

Keeping Networks Alive
